Equipment ›Comfort‹
Assembly and Operating Instructions
Differential temperature controller for solar thermal plants for drinking water heating and heating support

These Assembly and Operating Instructions are an integral part of the product.

> Read Assembly and Operating Instructions carefully before using the product.
> Keep them in a safe place during the product's service life.

Translation from the German original edition ©emz 2013 - Subject to modifications.

Important fundamental information

These instructions describe installation, commissioning, operation, repair and disassembly of the differential temperature controller **smart Sol** for solar thermal plants.
For operation of the entire plant, the technical documentation of all the components used such as solar collectors, boiler, tank, pumps, mixers and valves etc. must be complied with.

Danger!
Assembly, connection, commissioning, repair and disassembly of the controller may only be performed by a qualified specialist!

The controller is handled by the operator of the entire solar thermal plant, i. e. as a rule by technical non-experts.

Danger!
The controller by no means replaces the safety components required under plant engineering aspects!

Make sure not to use the controller until you have thoroughly read and understood these Assembly and Operating Instructions and the safety provisions. Comply with all safety provisions and involve a specialist in case of doubt.

Important!
The fitter installing the controller must inform the plant operator about operation, functioning and the method of action of the **smart Sol**!

Keep these Assembly and Operating Instructions and all reference documents so that they are available if required.

When relocating or when selling the device, hand the documents over to your successor.

Danger!
The device in operation may only be made accessible to adults disposing of appropriate knowledge and experience!

emz
smart solutions

When handling the differential temperature controller **smart Sol**
and the entire plant, please make sure that the following safety provisions
in the Assembly and Operating Instructions are complied with!

Danger!
Immediate danger for assets, life and limb!

Important!
Important information compliance with which is essential!

Note!
Useful information regarding handling of the device and the plant!

Description

The differential temperature controller **smart Sol** is an independent electronic controller for surface-mounting which is used for the control of solar thermal plants.

The controller is equipped with a robust three-part plastic housing which can only be opened by means of tools (screw driver PH2).

Operation is effected by means of only two control elements; indications appear against a backlit colour display.

Before connection of the electrical system, the controller must be mounted firmly to a perpendicular, robust surface (wall).

For its own supply and the supply of the outputs, the controller must be connected to an electrical energy supply system in accordance with the technical data.

Note!

The electrical equipment of the device must be installed firmly and connected to the power supply via a disconnector ensuring complete isolation from the power supply according to the erection regulations!

Assembly, connection, commissioning, repair and disassembly of the controller are only admissible in a specialist workshop.

To ensure correct operation, temperature sensors type Pt 1000 must be used - the sensor design does not affect function.

Each temperature sensor has two connectors which are equivalent, i. e. interchangeable. Thus, polarity reversal is not an issue.
The sensor lines can be extended up to a length of 100 m, to this effect, a cable cross section of 2 x 1.5 mm^2 is recommended.

Important!

Make sure that only a dry or slightly moistened cloth is used for cleaning and servicing of the housing, the control elements and the display.

The surfaces must never get into contact with cleaning products or solvents - mat, brittle or slightly dissolved plastic parts must be replaced immediately!

A device with damaged housing must not be operated!

Technical Data

Intended Use

The differential temperature controller may be used exclusively as controller for the control of solar thermal plants. It must be operated within the scope of all the specifications described. Installation and set-up of the controller may only be performed by specialists. The fitter must have read and understood the operating manual.
The fitter explains all the relevant functions to the operator.
For operation, it is essential that the housing is closed and free of damage.

Scope of supplies

1 Differential temperature controller **smart Sol**

1 Instruction manual

Differential temperature controller smart Sol

Type of mounting	Wall-mounting
Housing	Plastics, in several parts
Mode of operation	Type 1
Type of protection	IP 20
Dimensions Width x Height x Depth [mm]	115 x 173 x 46
Weight [g] Basic version	370
Storage/operating temperature [°C]	0-40, non-condensation
Handling	via rotary encoder and pushbuttons
Display	TFT colour display 47 x 35 mm, backlit

Connection to power supply

Design	3 spring-type terminals PE, N and L
Service voltage [VAC]	230 ±10%
Line frequency [Hz]	50 ±1%
Auxiliary consumption typ. [W]	1,74
Power consumption max. [W]	3.5
Fuse	Micro fuse, type 5 x 20 mm, T2A/250 V
Rated pulse voltage [V]	2500

Max. cross sections to be connected

Cable end sleeve:	0.25 to 0.75 mm^2
Single-wire	0.50 to 1.50 mm^2
Fine-wired	0.75 to 1.50 mm^2

emz
smart solutions

Interfaces TS1 / TS2 / TS3 / TS4

|	
Design	2 spring-type terminals each
Assignment as inputs Admissible temperature probe	Temperature sensor Pt 1000
Optional assignment of TS3 / TS4 to the impeller sensor	DFZ 1-100 pulses/litre
Optional assignment as output on TS4	PWM signal 100Hz...2kHz or analogue output 0...10V, max. 10mA

Triac outputs RO1 / RO2

Design	3 spring-type terminals each, PE, N and L
Output voltage [VAC]	230 ±10%
Output power max. per output [VA]	200
Output current max. per output [A]	1

Switching output REL: Floating change-over contact

Design	3 spring-type terminals
Switching voltage max. [V]	253
Switching capacity max. [VA]	230
Switching current max. [A]	1

The entire set-up and operation of the differential temperature controller **smart Sol** is effected via only two control elements on the device front.

All settings and interrogations are effected via the rotary encoder.

To find a required menu item, turn the rotary encoder to ›scroll‹ through the menu - the selectable option appears on a coloured background on the display.

To confirm the selected menu item, press the rotary encoder. An appropriate submenu is called up, or selection is activated.

Press the esc button to make the menu return by one level from any subitem.

If no input is made within the preset time (30-255 s), the controller returns automatically to the initial level.
Display

For indication of the operating mode and for communication in case of set-up, malfunction, modification and evaluation, the differential temperature controller **smart Sol** is equipped with a coloured full graphics display which is permanently backlit.

The display is active as long as there is supply voltage on the controller.

After a preset time (30 - 255 s), backlighting is dimmed to 10%.

Danger!

Mortal danger due to electrocution! Whenever work is performed on the open terminal cover, all poles of the power supply must be disconnected reliably and protected against being switched on again!

1 Release the lock screw.

2 Swing terminal cover forward ...

3 ... push it upwards ...

4 ... and remove it.

Store the terminal cover carefully and protect it against damage!

To close the terminal cover, reverse the opening procedure.

Wall-mounting

1 Fasten the top securing bolt so that a space of 2 to 3 mm is created between the wall and the screw head.

2 Move the device so that the upper fastening port is located above the screw head ...

3 ... and push it downwards.

4 Fasten the lower securing bolt.

If necessary, use dowel pins for wall-mounting!

emz
smart solutions

Danger!

Mortal danger due to electrocution! Whenever work is performed on the open terminal cover, all poles of the power supply must be disconnected reliably and protected against being switched on again!

The differential temperature controller **smart Sol** is connected to the power supply via three groups of spring-type terminals which are visible once the terminal cover is opened.
To introduce the cables, release the three screws on the strain relief device; if necessary, remove the strain relief device.

In case of flush mounting of the cables, the break-out segments in the housing base can be removed carefully and the cables routed through these ports.

The central terminal block is the interface to a potential-free change-over contact - here, it may be necessary to route electrical resistors into the spring-type terminals and to connect part of the cables via luster terminals.

The spring-type terminals for the power supply, RO1, RO2 and REL, and for TS1, TS2, TS3 and TS4 can accommodate solid wires up to a cross section of 1.5 mm². Appropriate stranded wires must be preassembled with cable end sleeves.
For the strain relief device function, TS1 to TS4 and REL require cable cross sections of at least 5mm, for Power, RO1, RO2 at least 7mm.

Volumetric flow sensor:

Measurement of solar radiation (heat quantity):
The solar yield is calculated from the flow rate and the differential temperature.
The differential temperature is the difference in the temperature of the collector
sensor and the solar circuit return line sensor.

An impeller sensor can be connected to TS3 or TS4 and must be adjusted during
installation. The temperature sensor for the solar return line must be set
in the menu ›1.1.4 Heat quantities‹. Solar radiation measurement using an
impeller sensor is possible for plant layouts 1, 2, 3, 4, 5, 7, 10, 12 and 14.

High-efficiency pump:

A high-efficiency pump can be connected via RO1 or RO2.
The appropriate control signal is issued at TS4.
Thus, TS4 is no longer available as input.
The control signal may be an analog voltage 0 - 10V or a PWM signal.

TS4: PWM-control signal
for the high-efficiency
pump

Left-hand terminal: GND
Right-hand termin.: Signal

RO1 or RO2:
230V supply of the
high-efficiency pump

For further details, please refer to the pump specification.
For definition and settings, the professional mode under 1.2.9 has been provided.

9-10 mm

The strain relief device can only ensure solid clamping if the cables are not stripped to a length of over 35 mm.

Insulation of the individual wires must be removed over a length of 9 - 10 mm to ensure safe electric contact in the spring-type terminal.

Stranded wires must be provided with cable end sleeves!

max. 35 mm

For connection, press the actuation pushbutton of the spring-type terminal using a screwdriver and insert the wire to its stop in the appropriate port.

Release the actuation pushbutton and pull the cable slightly to ensure that it is safely clamped.

Important!

Before closing the terminal cover, make sure the strain relief device is tightened safely.

Check once more that all cables are in good condition and connected correctly.

Hydraulic systems

Note!

Define structure and design of the plant already when planning the entire solar thermal system and align the design with the one of the hydraulic systems of the controller!

If you want to complete an existing system or replace the existing controller, please make sure that **smart Sol** is compatible with the existing configuration!

The sensors are connected to TS1 to TS4, the order not being significant; pumps and valves are connected to RO1 / RO2 - The interfaces are assigned to the functions in question on commissioning.

Connection to power supply

The functions for boiler control are accomplished via the potential-free relay contact which is connected accordingly to the relevant interface of the heating boiler.

The individual functions are assigned the following priorities:

A   Anti-legionella   priority 1
B   recharge suppression   priority 2
C   reheating   priority 3

Boiler

Anti-legionella function

The anti-legionella functions checks if the minimum heating for reduction of legionella has been achieved in the tank due to heating activity or solar heat within a set interval.

If no sufficient heating has been achieved by these means the controller starts a reheat cycle, specifically for reduction of legionella.

The fitter must set the parameters based on the applicable general directives and local requirements. The time of the disinfection cycle can be determined freely.

Reheat function

The temperature sensor in the upper tank area supplies the values for reheating.

For oil or gas operated systems, reheating takes place via the heating boiler.

For solid-fuel boilers, reheating takes place via the heat present in the drinking water tank. To this effect, the temperature within the tank must be within preset limits.

The temperature control is interlinked with six time blocks.

Reheating is activated as soon as the temperature falls below the set value by the hysteresis value in the current time block. When the set value is exceeded the reheating cycle stops.

Disable recharge

The efficiency of a solar plant increases as the recharge of the tank from the boiler decreases. Consequently, „disable recharge" means that recharging of the water tank is blocked by the boiler.

Time-controlled disable recharge

Recharge is blocked by the boiler for specific phases via a time program. Within the preset period of time (for ex. 7 to 19 h), recharge is blocked completely by the boiler without requiring the minimum temperature to this effect.

Time-/temperature-controlled disable recharge

If a minimum temperature in the tank is exceeded, disable recharge is activated.
This function can be activated in parallel to the time program.
If the preset minimum temperature (e. g. 45°C) in the tank
is exceeded, recharge of the tank is disabled by the boiler.
If, however, the minimum temperature is no longer reached, recharge is enabled
by the boiler no matter whether the time program blocks recharge or not.

Efficiency-optimized recharge suppression

If the calculated minimum temperature in the buffer tank is exceeded, the
disabled recharge feature is activated. The installer can specify two weighting
factors in menu 1.4.3 for the calculation of this minimum temperature:

Factor 1
Solar yield

Parameter values from 1-10 whereby:
1 = more solar yield, less recharge by the boiler
:
10 = less solar yield, more recharge by the boiler

Factor 2
Comfort

Parameter values from 1-10 whereby:
1 = lower comfort, less recharge by the boiler
:
10 = higher comfort, more recharge by the boiler

T min. tank (e.g.35°C)
Recharge active

Recharge suppressed
T targ. (e.g. 45°C)

Solar energy history

A flexible minimum temperature is thus calculated once per day which disables the recharge by the boiler.

This flexible minimum temperature is between ›T min. tank‹ and ›T target‹.

Factor 2 = 5
Factor 1 = 1

Factor 2 = 1
Factor 1 = 5

Factor 2 = 7
Factor 1 = 7
emz
smart solutions

Note!

For boilers without control input, the functions for boiler control can be accessed by the simulation of temperature values.

To enable reheating or anti-legionella functions, the corresponding boiler temperature must be increased at the boiler control.

The differential temperature controller **smart Sol** regulates the boiler control functions by a fixed value resistance simulating a charged buffer tank for the boiler.

The resistance value depends on the type of sensor the heating is adjusted to - this information is provided in the boiler manual.

| Sensor type	Pt 100	Pt 500	Pt 1000
R Terminal 12	130 Ω	620 Ω	1,3 kΩ
Colour code			

Connection provided at the REL terminal block, as illustrated.
Thermostat functions

The controller's free outputs can be used as thermostats for various applications.

Settings must be made to this effect in professional mode under ›1.3.1 Thermostat‹.

Control signals can be defined as temperature thermostat, timer, timer thermostat or temperature comparator.
Temperature thermostat ›Heating‹:
T OFF > T ON The output is deactivated once the
›T OFF‹ temperature is reached, and activated
once the ›T ON‹ temperature is reached.

Temperature thermostat ›Cooling‹:
T ON > T OFF The output is activated once the
›T ON‹ temperature is reached, and deactivated
once the ›T off‹ temperature is reached.

Timer function:
The output is activated
within a selected time frame.

Timer-Thermostat
Combination of timer and thermostat.
Once at least one of these criteria is met,
the output is activated.

Temperature comparator
Any temperature difference to a reference
sensor will trigger a control signal:
The output is activated once ›dT ON‹ is reached,
and deactivated once ›dT OFF‹ is reached.

emz
smart solutions

In a specific equipment version (with an extension module), the differential temperature controller **smart Sol** can be connected to the soft water station AQA solar of BWT Wassertechnik GmbH, Schriesheim.

AQA solar is a decalcification plant based on an ion exchanger, which ensures that the water lines and heat exchangers in your home are not damaged by scaling.
In case of very intense temporary heating of the drinking water, especially with thermal solar systems, decalcification is very useful to maintain efficiency.

Setup and operation of the equipment combination **smart Sol** and AQA solar is described in separate documentation and/or the operating manual of BWT.

For connection, the terminals ›Tx‹, ›Rx‹ and ›Gnd‹ above the interface terminals TS1 to TS4 are provided on the extension modules.

Integration of the soft water station is possible in all hydraulic systems of the **smart Sol**, and is displayed, e. g.:

In the main menu, information transmitted by the soft water station can be retrieved under ›1.8 AQA solar‹.

Important!

For commissioning, the controller must be assembled correctly, all inputs and outputs must be connected and ready for operation, the strain relief device must be screw-fastened and the terminal cover closed!

This is an explanation in terms of an example of commissioning of the differential temperature controller **smart Sol**; details vary along with the hydraulic configuration and the software version.

Commissioning is communicated in plain text; the user must make a selection, acknowledge and - if applicable - jump to the next menu item.

The differential temperature controller **smart Sol** accompanies you during the entire configuration and interrogates everything it must know for optimum operation.

Now, the power supply of the controller must be switched on - the display screen appears.

Note!

If a malfunction message appears in the display, the operator can define the possible causes by means of the Service Wizard so that he/she can provide the fitter with precise information.

The differential temperature controller **smart Sol** communicates malfunction processes in plain text. The Service Wizard indicates the possible causes of malfunctions on the basis of the detected symptoms and thus supports immediate and comfortable detection of deficiencies.

There may be various deficiencies in a solar thermal system, which require a wide variety of approaches. The controller communicates every step to the operator or fitter via the screen, so that there is no need to describe all malfunctions in detail in this operating manual.

Here, a malfunction message with troubleshooting process is presented as an example.

Replacement of fuse

To remove the device fuse, open the terminal cover.
Above the right-hand group of terminals, the fuse base and a spare fuse are
located. Pull the upper part of the support and the spare part out.
The fuse link is clamped in the formed piece and is removed together with the plastic
holder.

Now, push the micro-fuse laterally out of its holder.
The fuse link is installed by reversing the above order.
Make sure to procure yourself immediately a new spare fuse!

emz
smart solutions

Important!

In professional mode, settings are made which require detailed knowledge of the heating and solar plant.
Moreover, solid specialist knowledge regarding control engineering, hydraulics and solar thermal water heating is required!

If a single parameter is changed, this may affect the safety, function and efficiency of the entire plant!

Leave the settings in professional mode to a specialist workshop, the fitter or heating installer!

Modifications by non-experts tend to result in damage to the plant, rather than to an improvement of its efficiency!

1.7 Login

1.6.2 dT monitoring	
dT coll/stor	**30.0K**
t max.coll/tank	
	10min
Monitoring of	
	---▼
04.07.2012	10:44

›dT monitoring‹ is used to define the criteria which lead to fault detection.

›dT coll/stor‹ is used to define a differential temperature between collector and tank, and ›t max.coll/tank‹ for the relevant period of time.

If ›dT coll/stor‹ is exceeded within ›t max. coll/tank‹, the controller detects a fault.

With ›Monitoring of‹, the monitoring of the feed and return temperature
of the heat counter can be selected.

Continue with ›Volume flow‹.

1.6.3 Phi monitoring	
flow rate RO1	**►**
04.07.2012	10:40

›Phi monitoring‹ accesses any flow menu for which volume flow sensors have been configured.

Select appropriate submenu.

Here, the parameters for volume flow monitoring are defined.

Continue with ›Coll. Emerg.OFF‹.

1.6.3 Phi monitoring	
phi min.error	**0.10l/min**
phi circulation	1.00l/min
t undercut	▼
04.07.2012	10:44

›T limit Coll. 1‹ or ›T limit Coll. 2‹ are used to switch OFF the appropriate solar circuit pumps to prevent destruction.

To protect the pump, the collector emergency switch-off in solar circuits with high-efficiency pumps is reduced to 100°C.

Under ›Hyst‹, the value is entered by which the limit temperature must be undercut to cancel the forced shut-off.

Continue with ›Sensor balancing‹.

1.6.4 Emerg. OFF	
T limit Coll.1	**130.0°C**
Hyst.	5.0K
04.07.2012	10:45

Long piping and other factors may distort measured variables.

Here, an offset value can be entered for each sensor.

If the professional mode is not exited actively, the controller automatically displays the plant layout after the preset display shut-off time and the value of the access code is reset to 1.
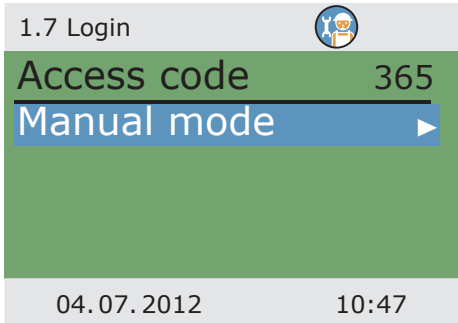

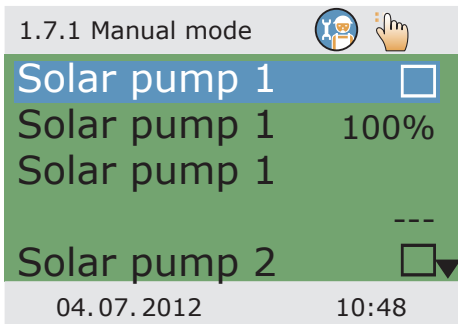

Return to ›Main menu‹.

Continue with ›Login‹.

1.6.5 Sensor balan...	
TS1 Offset	**0.0°C**
TS2 Offset	0.0°C
TS3 Offset	0.0°C
TS4 Offset	0.0°C

In manual mode, the individual outputs can be activated for testing purposes, e. g. to check that a pump is working properly.

Manual mode can only be exited by pressing ESC.

Disassembly/Disposal

Danger!

Mortal danger due to electrocution!
Before opening the terminal cover,
disconnect all poles of the power supply reliably!

For disassembly of the differential temperature
controller **smart Sol**, reverse assembly procedure:

- Disconnect the power supply.

- Open the terminal cover.

- Disconnect all cables.

- Release the wall screw fastening.

- Remove the controller from its mounting location.

Danger!

Mortal danger due to electrocution!
When removing the controller, secure all stripped
cable ends so that they cannot be touched by persons!

Remove cables completely on definite removal.

Important!

The person who or the institute which is responsible for disposal of
the device must not discard the controller with the residual waste, but
must ensure correct recycling in accordance with the local provisions!

In case of doubt, ask the local disposal company or the
authorized dealer from which you have purchased the device.

Warranty and liability

The differential temperature controller **smart Sol** was developed, manufactured and tested according to stringent quality and safety specifications and corresponds to the state of the art.

The device is subject to the warranty period prescribed by law of 2 years after the date of sale.

The seller shall eliminate all defects in material and workmanship which occur on the product during the warranty period and which impair the product's functionality.

Natural wear and tear does not constitute a defect.

Warranty and liability does not include all damage which is due to one or several of the following reasons:

• Non-compliance with these Assembly and Operating Instructions.

• Inappropriate transport.

• Faulty assembly, commissioning, maintenance or operation.

• Modifications of the structure or tampering with the software of the device.

• Installation of supplementary components which are not approved by the manufacturer.

• Continued use of the controller despite an obvious defect.

• Use of non-approved spare parts and accessories.

• Applications exceeding the intended scope of utilization.

• Inappropriate utilization of the device / improper handling, e. g. ESD.

• Use of the device outside of the admissible technical boundaries.

• Voltage surges, e. g. due to lightning strokes.

• Force majeure.

Further claims based on this warranty obligation, especially compensation for damage exceeding the asset value of the differential temperature controller, are excluded.

Construction, design and project engineering of heating installations are performed by specialist fitters based on the applicable standards and directives.

The functioning and safety of a plant are the exclusive responsibility of the companies commissioned with planning and execution.

Contents and illustrations of this manual have been elaborated to the best of our knowledge and with utmost diligence - we reserve the right of error and technical modifications.

Liability of the manufacturer for inappropriate, incomplete or incorrect information and all damage resulting therefrom is excluded on principle.

Commissioning report

Name of operator and place of installation:

_____

_____

Important!

For repair or replacement of the controller, make sure that completed copies of the commissioning report and of the error report are included!

EC Declaration of conformity

The manufacturer

emz-Hanauer GmbH & Co.KGaA
Siemensstraße 1
D - 92507 Nabburg

declares in its sole responsibility that the following product:

Differential temperature controller **smart Sol**

to which this Declaration refers, complies with the following directives and standards:

Directive 2006/95/EC of the European Parliament and the Council dated 12 December 2006 on the harmonization of the laws of the Member States relating to electrical equipment designed for use within certain voltage limits.

Directive 2004/108/EC of the European Parliament and the Council dated 15 December 2004 on harmonization of the laws of the Member States relating to electro-magnetic compatibility and abolition of the Directive 89/336/EEC.

Directive 2001/95/EC of the European Parliament and of the Council dated 3 December 2001 regarding general product safety.

Technical regulations, Low-Voltage Directive:

EN 60730-1:2000 + AC:2007

Technical regulations, EMC Directive:

EN 60730-1:2000 + A1:2004 + A12:2003 + A13:2004 + A14:2005 (EMC part)

EN 55022:1998 + Corr. 1999 (Class B)

EN 61000-3-2:1995 + corr. July 1997 + A1: 1998 + A2:1998 + A14:2000

EN 61000-3-3:1995 + A1:2001 + A2:2005

D - 92507 Nabburg, 29.04.2013,
